

Module 7: Implement & Present

0% Completed

Weekly tasks (0
/ 2) ▼

Assessments (0
/ 2) ▼

During this Module, you are expected to:

1. Use the feedback from your instructor and his/her continued guidance to **finalize your Capstone Project** including the **executable code** supporting your analysis and results.
2. Use the instructions provided in the [Recorded Presentation Guidelines](#) section to create, record, and submit your project presentation.
3. Submit the **final project** by the last day of the Module and the course. This submission should contain links to the full code repository, detailed explanation of code structure and its most critical pieces, detailed analysis of the results and inferences drawn.
4. Submit the link to your **recorded presentation by the Saturday following the course end date**. Take advantage of the additional 5 days to improve your presentation.

Submit Your Final Project M7

You have not been assigned to a group yet.

Carefully read and follow the submission instructions below:

Before the submission deadline:

- While completing the project, designate one group member who will upload and submit the group work project on behalf of your group.
- Don't wait until the last minute to upload your work: Make sure to use Turnitin and check your similarity report to avoid plagiarism.
- Remember, the submitting group member can (re-)upload an updated and improved version of your work up to 5 times prior to the submission deadline.
- Before the submission deadline, use Turnitin to check your similarity report, and then upload an updated version of your submission if necessary

Ready to submit:

- If your submission is composed of multiple files, upload the PDF report separately from the zipped folder that includes all additional files (spreadsheets with data, charts, code).
- Make sure you also submit any **source code generated** within the capstone project, with appropriate comments and descriptions
- Make sure that the submitting group member has uploaded the final version of your project.
- After the deadline, your submission can no longer be changed by any of the group members. Groups

who have not made any submission will not be able to upload their work.

For the final project, you will need to submit the following documentation:

- **Project Report** using one of the templates provided (10-12 pages single spaced or 15-20 double spaced, for ~3,500 words at minimum)
- **Solution Design Document** for the associated source code
- **Code Repository/ Online Hosted Notebook**

You can use any of the strategies you have learned about in the previous 9 courses as the basis for your project. Make sure that the selected method provides you with the results you will need in order to answer your initial problem statement. Further, make sure that your Project Report uses an academic template and follows academic reporting guidelines, clearly discusses all aspects of the project, and represents the results in a clear and concise way.

In addition to your Project Report, you must include a one-page document that lists the project specifications and solution architecture (Solution Design Document). This document should be understandable by someone with no programming background – imagine it as a business case for your solution that needs to be signed off by your manager before you can build and deploy it. It should list out specific areas of the code and what it is meant to address/achieve. Remember that though your code would be very familiar to you, it is very difficult for a third person to directly read the code and understand it.

If you are using Python scripts and have shared an online repository of code files, then you are also required to submit all of your source code and a README file via a shared GitHub project so that your instructor is able to clone the repository and run your project locally. Include a requirements.txt file for Python which would help the instructor to install all requirements packages using a “pip install –r

requirements.txt” command. This document must contain any specific instructions for how your program should be executed. In case you have used a hosted Python notebook, then this step can be ignored.

Finally, your source code should be clear, fully commented, and optimized as best as possible. Refer to the Capstone Source Code Development Guidelines published in the Course Overview of your online course room for further details.

Grading Rubric (30.4% or 280 + 24 points for group collaboration)

Final Project 100 Points	Source Code 100 Points	Conclusions 50 Points	Writing and Formatting 30 Points
The Final Project Report is clear and complete and: • Includes a clear project description • Includes pain-points in current quantitative finance strategies • Explains how the current project helped in the context • Discusses follow up work and other possible real life applications of your research/project idea • Includes clear results explained and discussed with visual representations.	The submitted source code not only meets requirements but also implements functionality in the most optimal way. The code should be well structured and well commented. A person who is new to the code should be able to execute it and get the same results as presented in the project report. The underlying data for the code should be available for verification.	The Final Project Report includes a strong review of key conclusions and a solid integration with the thesis statement. Insightful discussion of the impact of the research completed is also included. Conclusions should be clearly supported by results obtained from the code developed.	A submission that looks professional should include: • Axes, labels, and scales in graphs • No significant grammar errors or typos • Organized, clear structure, and easy to read document • Proper citations and bibliography using MLA format

Recorded Presentation Guidelines

Overview

The last assignment for this course consists of a **recorded presentation** of your Capstone project. If you worked in a group, note that **each group member** must submit a recorded presentation of the **full project**.

The length of each recorded presentation should be about **10 minutes**. You will be subject to **grade penalty** if your presentation is longer or much shorter.

As part of the **graduation requirements**, your recorded presentation will also be used to **verify your identity**.

Technical Requirements

Watch this [short video](#) to learn about the requirements for your presentation including its scope, length, and the talking points you are expected to cover.

Click [\[here\]](#) view a static version of the video with slides and video transcript.

Instructor Expectations

Watch [this video](#) for further guidance and to better understand the expectations from your instructor.

Presentation Template

Use this [PowerPoint template](#) to develop your

presentation. If you do not have access to Microsoft PowerPoint, you can upload the template in Google Docs, or you can use this [***PDF version***](#) to create slides with Pages on a Mac computer.

How to Record Your Presentation

To record your presentation you should use Zoom, a free video recording application. Refer to [***this guide***](#), for more information about how to use Zoom to record your presentation and how to share a google drive link to your MP4 recording.
